Human | Winning | Sovereign

Secrecy One Ltd

Human focus | Winning digital | Sovereign vocation

# An AI to make you smile

*warmly* captured,  
evidenced, and validated

# How does *AI* make you feel?

# How does *AI* make you feel?

## Like a watchful raccoon?

# How does AI make you feel?

## Like a self-drive vehicle that doesn't?

# How does AI make you feel?

## Or like a human being who now fears for your humanity?

**How does AI make you feel?**

**How *really* do you feel?**  
**No bosses. No thinking**  
**about what people might**  
**say. Just you, me and**  
**maybe 200 people**  
**more ... is all.**

# I'd like to change the narrative ...

# I'd like to change the narrative ...

But first ... if *you could* ...  
how would YOU change AI  
for us all? What would  
YOUR ideal narrative tell  
us?

# And so this is my narrative ... or rather, its **keywords** ...

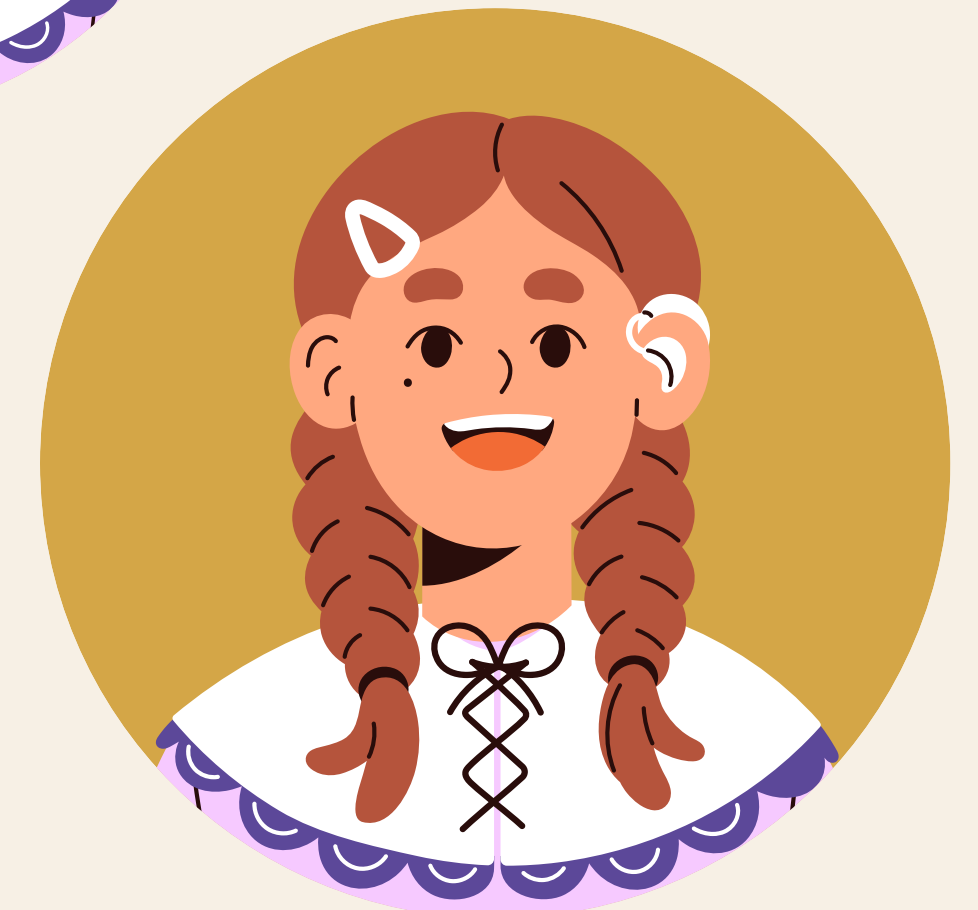

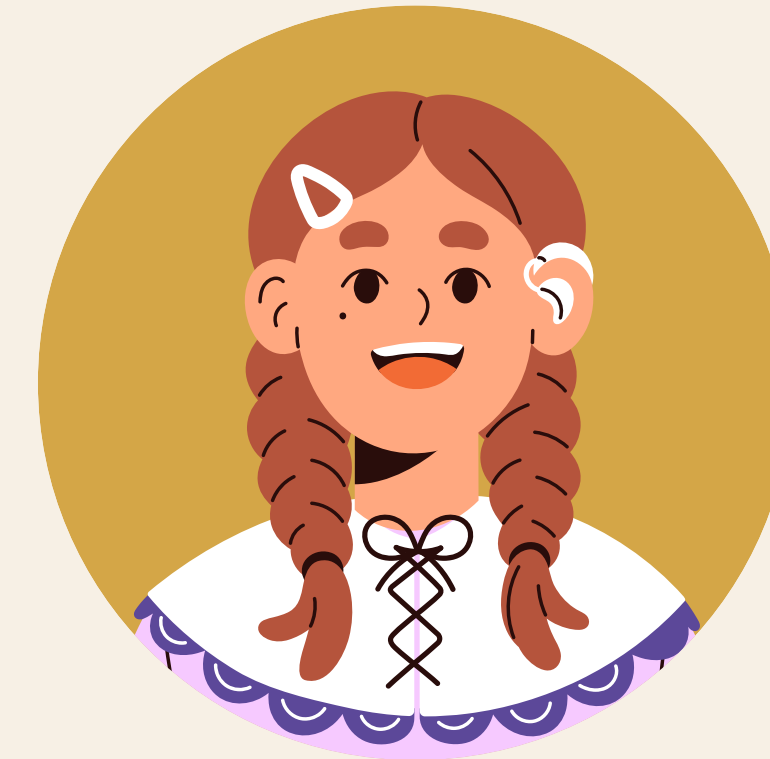

- **Less automating us out of utility and the workplace**

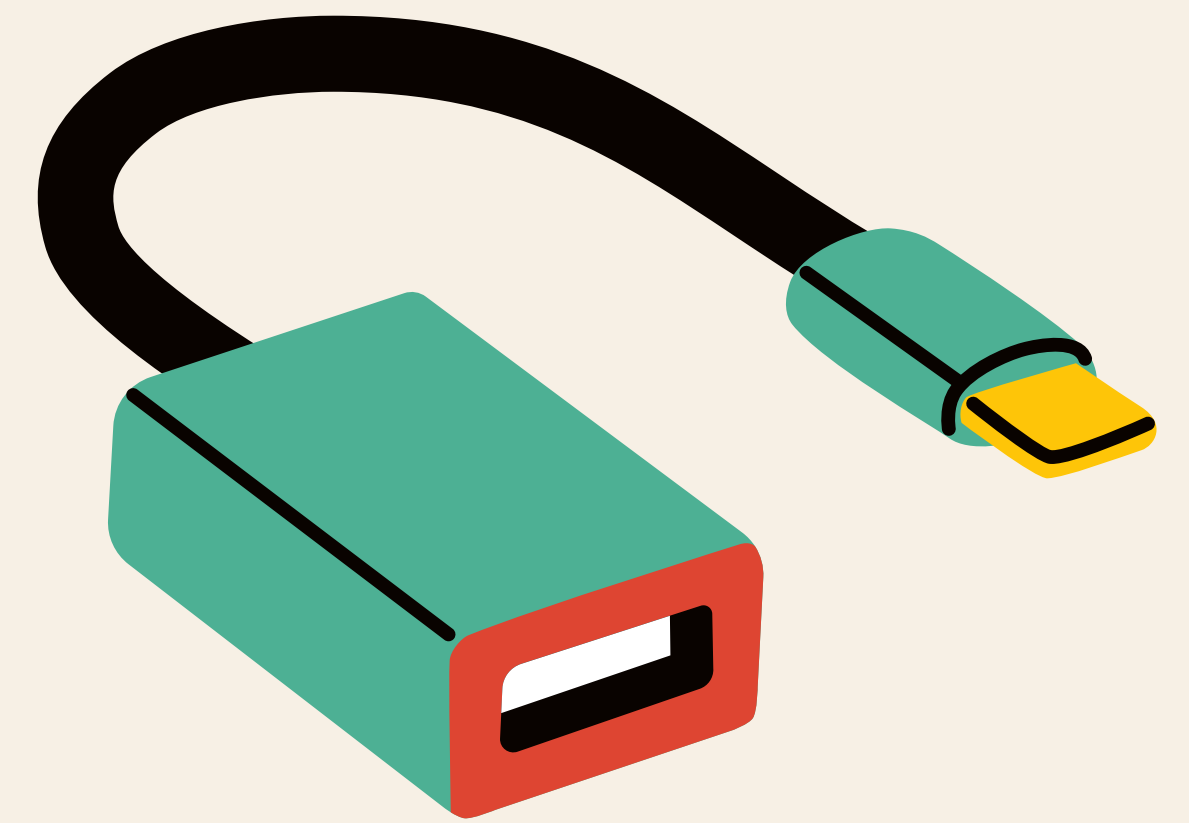

- **More industrialising us firmly back into both**

- **Capture, evidence and validate** where we are **supreme**: our **intuition, arationality, high-level domain expertise, mission-critical thinking without thinking, gut feeling, and hunches**

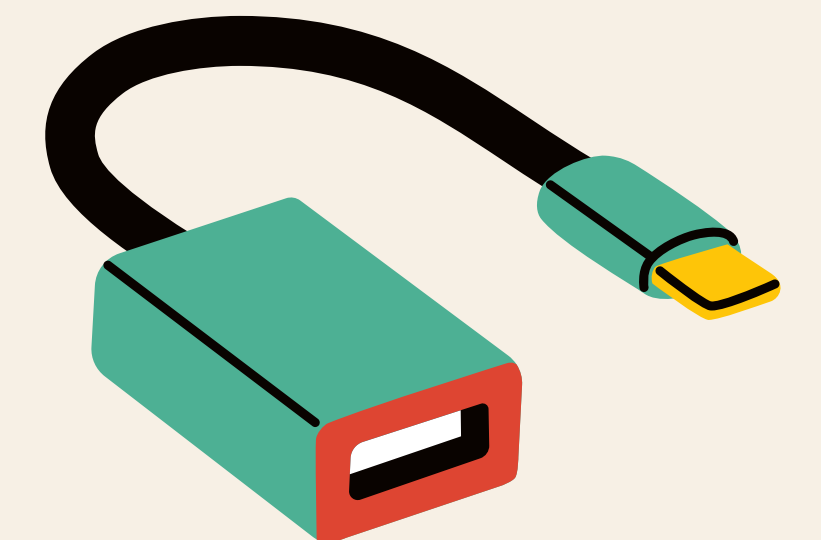

- But not using admins lording over users: instead, **change the architectures back to those that Steve Jobs enjoyed; architectures we haven't enjoyed for 40 years and more — the freedom to think before we share**

- **Neither humans nor machines as tools of the other, but both as partners in purposefully shared outcomes**

# intuition-validation-engine

---

The goal of this engine is to permit both human and machine intuition to be validated.

This will be done constantly, but not intrusively. People and machines will have a choice, always.

It is assumed that for the purposes of this project both parties will be encouraged to upskill the other in mutual dialogue and equal partnership.

It is also assumed, a priori, that the keywords for the processes involved will be:

<https://secrecyone.co.uk/i-ve>

1. A procedure of CAPTURE, controlled by humans on the one hand and machines on the other, where neither will be obliged to share ideas, content and personal data that they do not feel safe sharing.
2. A procedure of EVIDENCING, where the captured data can be stored, retrieved, shaped and patterned, and used for supportive purposes that expand the lives and experiences of the beings concerned.
3. A procedure of VALIDATION, where it becomes clear to everyone participating:  
a) why a human being might believe and act in a certain way; and equally so, b) why the machines that prefer to work within the framework of this project will arrive at their own particular positions and conclusions.

<https://secrecyone.co.uk/i-ve>

arrive at them with particular people and considerations.

Finally, it is hugely important that everyone who chooses to work on the project might easily understand that it is not a traditional software paradigm: let us assume, instead, that people, code, machines and all other objects participating will form part of a new space we might call "i've".

That is to say, there will be no distinction or hierarchy in this space between the individuality of the objects in question, with respect to their entity as sovereign actors. In this sense, all will enjoy becoming part of a multiple-perspective environment, and all will help to support and contribute to a wider and transcendental knowledge that both befits and benefits others.
